SVN checkout or RDK 2.0 to Windows

Hi

When I checkout the RDK 2.0 code components to my Windows computer, there is a problem with the files in "mediaframework/trunk/erouter_gui/www /router_php".

The repository has "mta_Line_Diagnostics.php" and "mta_line_diagnostics.php" as well as "mta_Line_Status.php " and "mta_line_status.php". While this does not cause any problem in a case-sensitive file system like Unix/Linux, Windows and Tortoise SVN always reports that there are files missing from the "router_php" directory (which is certainly the case)

These files seem to have different content, so could someone look into uniquely renaming them.
