 - 1.4.3. RPI-Board
- 1.5. Conclusion
- 1.6. Limitations

1.1. Introduction

The Firmware upgrade will upgrade higher or lower version of the current image in RPI target with the help of Xconf server and Local TFTP server.

This page dedicated to bringing up and validation of Firmware upgrade in RPI-0 and RPI-3 B+.

1.2. Yocto Build Steps

Refer below link to build camera image

Morty:

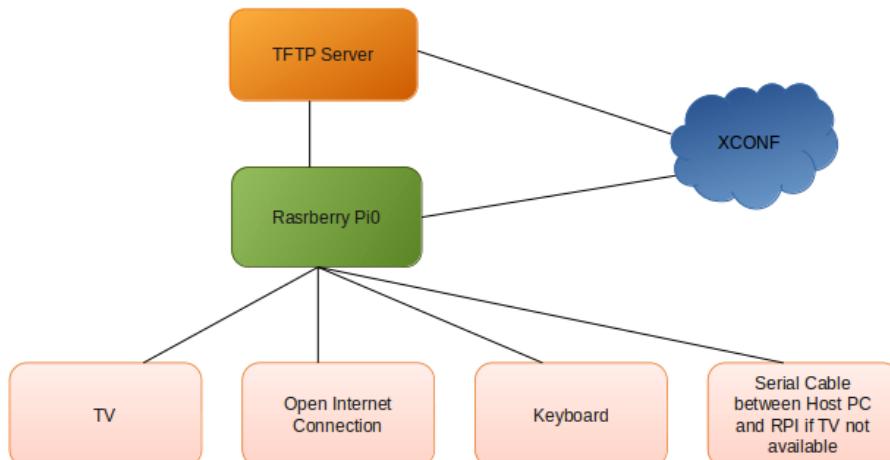

[RDK-C Build Instruction for RPI-0](#)

[RDK-C Build Instruction for RPI-3](#)

Dunfell:

[RDK-C rdk-next Yocto 3.1 dunfell build for Raspberry Pi](#)

1.3. Test Setup Block Diagram for RPI RDK-C Firmware Upgrade

1.4. Firmware Upgrade Validation Procedure

1.4.1. TFTP Server Setup

STEP 1:

Install xinetd and tftpd-hpa application in your local PC to setup tftp server by using below command

TFTP Server Installation Step

```
sudo apt-get install xinetd  
sudo apt-get install tftpd-hpa
```

STEP 2:

Create checksum file for your upgrading image.

Dunfell:

Before creating checksum file, need to decompress the .wic.bz2 camera image with the below command

```
$ bzip2 -dk camera_image
```

Example:

```
$ bzip2 -dk rdk-generic-camera-image_default_20201125081842.rootfs.wic.bz2
```

After decompression, we may get "rdk-generic-camera-image_default_20201125081842.rootfs.wic" this image.use this image to create checksum file and firmware upgrade.

md5sum checksum creation

Morty:

```
md5sum "<imagefile_name>.rootfs.rpi-sdimg" > imagefile_name.txt
```

for Ex:

```
upgrading image file is rdk-generic-camera-image_default_20200329074421.rootfs.rpi-sdimg  
md5sum "rdk-generic-camera-image_default_20200329074421.rootfs.rpi-sdimg" > rdk-generic-camera-  
image_default_20200329074421.txt
```

Dunfell:

```
md5sum "<imagefile_name>.rootfs.wic" > imagefile_name.txt
```

for Ex:

```
upgrading image file is rdk-generic-camera-image_default_20201125081842.rootfs.wic
```

```
md5sum "rdk-generic-camera-image_default_20201125081842.rootfs.wic" > rdk-generic-camera-  
image_default_20201125081842.txt
```

STEP 3:

Create new folder for example "tfphome" in your PC home direcotry to maintain checksum file and upgrading image file.

Keep upgrading image file and checksum file in your created folder.

For Ex:

Morty:

Keep rdk-generic-camera-image_default_20200329074421.rootfs.rpi-sdimg and rdk-generic-camera-image_default_20200329074421.txt files in your tfphome folder.

Dunfell:

Keep rdk-generic-camera-image_default_20201125081842.rootfs.wic and rdk-generic-camera-image_default_20201125081842.txt files in your tfphome folder.

STEP 4:

Check tftp file is there or not in /etc/xinetd.d/ directory. if it is not there then create tftp file under this /etc/xinetd.d/ direcotry and add below content.

```
vi /etc/xinetd.d/tftp
```

TFTP File Content

```
service tftp
{
protocol      = udp
port          = 69
socket_type   = dgram
wait          = yes
user          = nobody
server         = /usr/sbin/in.tftpd
server_args    = -c -v -s /home/xyz/tftphome ( Give upgrading file and checksum file maintained directory )
disable        = no
}
```

STEP 5:

Verify /etc/default/tftpd-hpa file content

```
vi /etc/default/tftpd-hpa
```

tftp-hpa File Content

```
# /etc/default/tftpd-hpa

TFTP_USERNAME="tftp"
TFTP_DIRECTORY="/home/xyz/tftphome" ( Give upgrading file and checksum file maintained directory )
TFTP_ADDRESS="0.0.0.0:69"
TFTP_OPTIONS="--secure"
```

STEP 6:

Start tftp server and xinetd server

```
sudo service tftpd-hpa restart
sudo /etc/init.d/xinetd restart
```

1.4.2. XCONF Server Setup

1.4.2.1. XConf URL

Enter XConf server wiki page with below URL to create Environment,Model,Mac list,Firmware config,Firmware rule and Download Location Round Robin Filter.

XConf URL

```
http://35.155.171.121:9093/admin/ux
```

1.4.2.2. Create Environments

STEP 1:

Select Environments option within common list to enter Environments page.

After entered Environments page press create button to add your device environment detail.

The screenshot shows the XConf interface with the 'Environments' tab selected. The left sidebar has 'Common', 'Firmware', 'DCM', 'Telemetry', 'Settings', 'RFC', and 'Tools' dropdowns. The top right shows 'Application' status with 'First 05/29/2020 UTC 01:51:15'. The main area displays a table with columns 'Id', 'Description', and 'Actions'. The entries are:

Id	Description	Actions
AUSA-TEST	Altice-USA Validation Test	[Edit, Delete, Download]
AX061AEI	RT1319	[Edit, Delete, Download]
COGMATION_ENV	Cogmation Test	[Edit, Delete, Download]

STEP 2:

Give ID and Description to setup Environment for your device and save that details in xconf server..

The screenshot shows the 'Environment' edit page. The top navigation bar includes 'Common', 'Firmware', 'DCM', 'Telemetry', 'Settings', 'RFC', and 'Tools'. The main area has fields for 'Id' (containing 'RDK-C_Test') and 'Description' (containing 'RDK-Camera'). At the bottom are 'Save' and 'Cancel' buttons.

1.4.2.3. Create Model

STEP 1:

Select Models option within common list to enter Models page.

After entered Models page press create button to add your device model detail.

This screenshot is identical to the one above, showing the XConf Environments page with the same three entries and layout.

STEP 2:

Give ID and Description to setup Model for your device and save that details in xconf server..

The screenshot shows the 'Model' edit screen in the xConf web interface. At the top, there are navigation links: Common, Firmware, DCM, Telemetry, Settings, RFC, Tools. On the right, there are application status boxes for 'Application' (First 05/29/2020 UTC 02:01:38) and 'Tools' (First 05/29/2020 UTC 02:01:38). The main area has a title 'Model'. Below it, there are two input fields: 'Id' containing 'RDK-C_Test' and 'Description' containing 'RPI0'. At the bottom are 'Save' and 'Cancel' buttons.

1.4.2.4. Create MAC List

STEP 1:

Select MAC Lists option within common list to enter MAC Lists page.

After entered MAC Lists page press create button to add your device MAC detail.

The screenshot shows the 'Models' page in the xConf web interface. The left sidebar has tabs for 'Environments' and 'Models'. Under 'Models', there are sub-tabs: 'MAC Lists' (selected), 'IP Lists', and 'Common'. A search bar 'Search by Id' is available. To the right, there is a 'Create' button and an 'Export All' link. The main table lists three entries:

Id	Description	Actions
AX061AEI	rt1319	[Edit, Delete, Download]
COGMATION_BB	Cognition_BB_model	[Edit, Delete, Download]
EMULATOR	RDKB Emu	[Edit, Delete, Download]

STEP 2:

Give Name and Data to set MAC detail for your device and save that details in xconf server..

The screenshot shows the 'Add MAC List' screen in the xConf web interface. At the top, there are navigation links: Common, Firmware, DCM, Telemetry, Settings, RFC, Tools. On the right, there are application status boxes for 'Application' (First 05/29/2020 UTC 02:07:13) and 'Tools' (First 05/29/2020 UTC 02:07:13). The main area has a title 'Add MAC List'. It includes a file upload section with 'Choose File' and 'Browse' buttons. Below are two input fields: 'Name' containing 'RDK-C_Test' and 'Data' containing 'Please enter item'. A preview box shows the MAC address 'B8:27:EB:2E:72:2B'. At the bottom are 'Save' and 'Cancel' buttons.

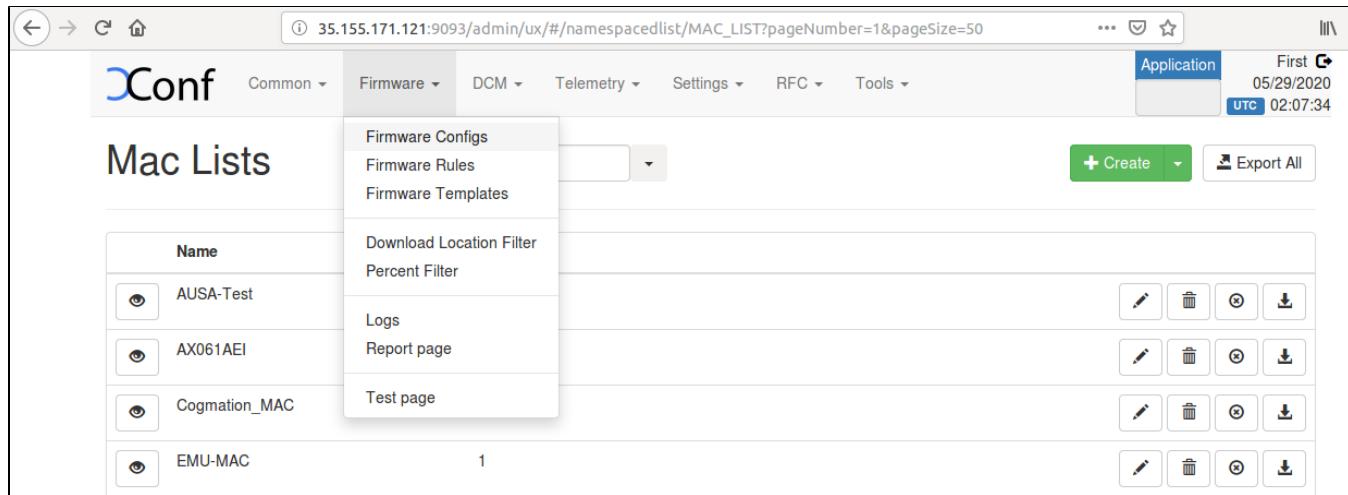

1.4.2.5. Create Firmware config

Ensure application type is stb. If the application type is xhome then change application into stb.

STEP 1:

Select Firmware Configs option within common list to enter Firmware Configs page.

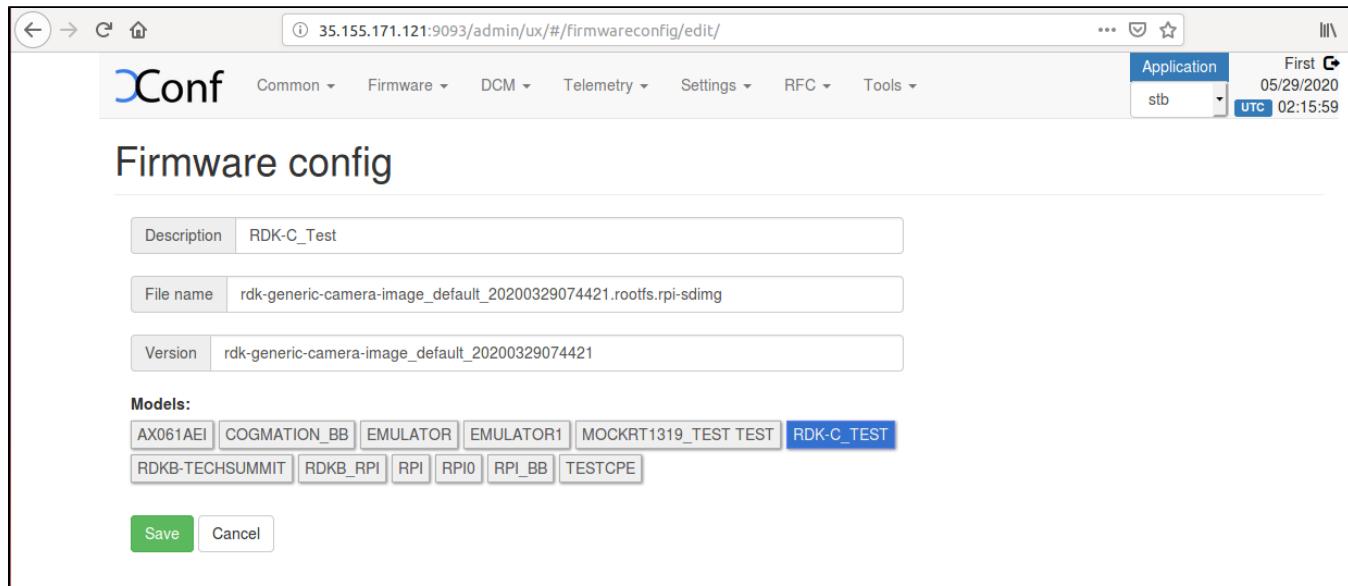

After entered Firmware Configs page press create button to add your device firmware configuration detail.

The screenshot shows the XConf interface with the 'Firmware' tab selected. Under 'Mac Lists', there is a table with columns for Name, Download Location Filter, Percent Filter, Logs, Report page, and Test page. Each row has a small icon and a set of edit, delete, and download buttons. A modal window is overlaid on the table, containing links to 'Firmware Configs', 'Firmware Rules', and 'Firmware Templates'.

STEP 2:

Give Description,File name (Upgrading image name),Version(Upgrading image name without .rootfs.rpi.sdimg) and select your model name and save the details in xconf server.

The screenshot shows the 'Firmware config' creation page. It includes fields for 'Description' (set to 'RDK-C_Test'), 'File name' (set to 'rdk-generic-camera-image_default_20200329074421.rootfs.rpi-sdimg'), and 'Version' (set to 'rdk-generic-camera-image_default_20200329074421'). Below these are 'Models:' checkboxes for various device models, with 'RDK-C_TEST' being the selected one. At the bottom are 'Save' and 'Cancel' buttons.

1.4.2.6. Create Firmware Rule

STEP 1:

Select Firmware Rule option within common list to enter Firmware Rule page.

After entered Firmware Rule page press create button to add your device firmware Rule detail.

The screenshot shows the DConf interface for managing firmware configurations. The top navigation bar includes links for Common, Firmware, DCM, Telemetry, Settings, RFC, and Tools. On the right, there are application status indicators for 'Application' (stb), 'First' (05/29/2020), and 'UTC' (02:16:54). The main content area is titled 'Firmware con' and displays a table of firmware templates. The table has columns for 'Description', 'Supported Models', and 'Actions'. The 'Description' column lists template names like 'Cogmation_config', 'CPEfirmware', 'emulator_firmware', and 'Firmware_Camera'. The 'Supported Models' column lists device models such as 'COGMATION_BB', 'TESTCPE', 'EMULATOR1', and 'RPI0'. The 'Actions' column contains icons for edit, delete, and download.

Firmware con		Firmware Configs	Search by Model	Create	Export All
Description	Supported Models	Actions			
Cogmation_config	-broadband-image_default_20200406103506.txt	COGMATION_BB			
CPEfirmware	Logs Report page	TESTCPE			
emulator_firmware	Test page	EMULATOR1			
Firmware_Camera	rdk-generic-camera-image_default_20200527100029	RPI0			

STEP 2:

After entered firmware Rule page you can see list of template.

Choose MAC_RULE in this list of Template to add your device MAC list in Firmware Configuration.

The screenshot shows the 'Add Firmware Rule' page. The top navigation bar is identical to the previous one. The main content area is titled 'Add Firmware Rule' and features a heading 'Please Select a Template'. Below this, there is a list of template options: ENV_MODEL_RULE, IP_RULE, IV_RULE, MAC_RULE, and MIN_CHECK_RULE. Each option is represented by a small rectangular button.

STEP 3:

After entered Firmware Rule page.If any estbmac if there under build condition then remove that estmac before add your device specific Firmware rules.

PROPERTIES

Name: RDK-C_Test Type: MAC_RULE

BUILD CONDITIONS

eStbMac IN_LIST

Please provide value for each condition in the rule:
click condition, enter fixedArg value, then click Plus button to save that condition.
Note: Key value in condition can't be modified. It's not allowed to add new conditions.

STEP 4:

Add your device specific eStbMac under build condition option.

Select your firmware config under Action option and save your Firmware rule in XConf server.

PROPERTIES

Name	RDK-C_Test	Type	MAC_RULE
------	------------	------	----------

BUILD CONDITIONS

eStbMac IN_LIST RDK-C_Test

AND OR not IS +

Please provide value for each condition in the rule:
click condition, enter fixedArg value, then click Plus button to save that condition.
Note: Key value in condition can't be modified. It's not allowed to add new conditions.

ACTION

Action Type	RULE
NoOp	false
Firmware Config	Cognition_config

Save Cancel

1.4.2.7. Edit Download Location Round Robin Filter

1.4.2.7.1.1. With selection of HTTP Protocol

Server Set-up :

1. Install the apache2 http server in local pc
2. Add the below line in /etc/hosts (192.168.0.107(wan IP) <http://myfirmware.com>)
3. place the rpi image and checksum files in document root directory.

XCONF side :

- 1.Select Download Location filter under the firmware tab in XCONF UI
- 2.click the edit button
- 3.Enter the "Location (FQDN)" field is local/Public http server (fully qualified domain name) (ex : www.myfirmware.com)
- 4.Enter the "Location (full URL)" field is full location path of local/Public http server (ex : <http://www.myfirmware.com>)
- 5.Unclick the check box of Never use HTTP
6. Removed the model name from Rogue Models.
- 7.Removed the firmware version (If it's not updated earlier, please ignore this step).
8. click the save button.

RPI Target :

- 9.In DUT, please edit the following file with below format,If it's local http server
 - i) Open the /etc/hosts
 - ii) Add your local http server ip with DNS (Ex : 192.168.0.128 www.myfirmware.com)
 - iii) Save the file.

Note : Every reboot, You need to add the above three steps if it's local http server.

Download Location Round Robin Filter

1.4.2.7.1.2. Verify XConf server configuration

Verify that XConf Server configuration displays the Json response from the mentioned URL:

Using the below url to view the JSON Format result of http protocol ,

http://35.155.171.121:9092//xconf/swu/stb?eStbMac=<RPI MAC ADDRESS>&model=<model_name>&capabilities=RCDL&capabilities=supportsFullHttpUrl

```
JSON Raw Data Headers
Save Copy Collapse All Expand All ⌂ Filter JSON
firmwareDownloadProtocol: "http"
firmwareFilename: "rdk-generic-camera-image_default_20201125081842.rootfs.wic"
firmwareLocation: "http://www.myfirmware.com"
firmwareVersion: "rdk-generic-camera-image_default_20201125081842"
rebootImmediately: false
```

1.4.2.7.1.3. Http Location folder:

Verify that image file and its respective md5 checksum file is present in the http folder:

```
lts40009681@CHTSL20070:/var/www/html$ ls
rdk-generic-camera-image_default_20210107140802.rootfs.wic.bz2
rdk-generic-camera-image_default_20210107140802.txt
```

1.4.2.7.1.4. With Selection of TFTP Protocol

STEP 1:

Select Download Location Filter option within common list to enter Download Location Filter page.

After entered Download Location Filter page press create button to add your Download Location detail.

The screenshot shows the D-Conf Firmware Rules interface. In the top navigation bar, under 'Common', the 'Download Location Filter' option is selected. On the left, there's a sidebar with 'Rule Actions' and a list of rules: 'Cogmation_BB' and 'Deepthi_test'. The main area displays two rows of download location filters. The first row for 'Cogmation_BB' has a 'Logs' column with 'Report page' and 'Test page', a 'Rule' column with 'Cogmation_MAC', a 'Targeted Models' column with 'COGMATION_BB', and a 'Configuration' column with 'Cogmation_config'. The second row for 'Deepthi_test' has a 'Logs' column with 'eStbMac IS B8:27:EB:15:07:5E', a 'Rule' column with 'RPI', and a 'Targeted Models' column with 'RDKV_test'. Each row has edit and delete icons. At the top right, there are buttons for 'Create' and 'Export All'.

STEP 2:

After entered Download Location Round Robin filter press edit button to edit your image downloading details.

Enable Never use HTTP and select your Rogue model.

Give TFTP server running IP address to download image.

XConf Application First 05/29/2020 UTC 02:27:26

Save Copy Collapse All Expand All

```

firmwareDownloadProtocol: "tftp"
firmwareFilename: "rdk-generic-camera-image_default_20200329074421.rootfs.rpi-sdimg"
firmwareLocation: "192.168.1.102"
firmwareVersion: "rdk-generic-camera-image_default_20200329074421"
rebootImmediately: false

```

1.4.3. RPI-Board

1. Flash the RDKC image supported for Firmware upgrade feature in the Rpi and verify the 2 partitions(ex. mmcblk0p1, mmcblk0p2) present under dev folder (use command ls /dev)
2. Device auto-reboots and verify there are 2 more additional partitions are created (ex. mmcblk0p3, mmcblk0p4).
3. Open /etc/include.properties file and verify the CLOUDURL parameter where XConf Server URL is configured
4. Verify the image version (cat /version.txt) displays the flashed image version
5. Open /rdklogs/logs/swupdate.log to verify the communication from RPI board with XConf Server and the download status
6. Verify the ftp download is happening by noticing the change of file size using below command: ls /extblock/tftpimage/imagedwnldls -sh (use this command frequently to verify the file size change)
7. Once image download completed, the Rpi board will auto reboot and come up with downloaded image
8. Verify the version of booted image which shows the downloaded image version

1.5. Conclusion

Please find the summary on firmware upgrade explained above

- Build the image RDK-C Image.
- Ensure 8GB sd-card is available for flashing
- Flash the build image to sd-card
- Setup xconf server ready with rules and download location for RPI device
- Place the upgrading image and checksum file in tftp server
- Boot the flashed image

Note :

1. RPI will go for reboot while booting for the first time, since two more partition needs to be created which requires reboot. Depends on the image present in xconf and RPI, further reboot will happen for upgrade. Please refer to design ([Firmware Upgrade Support in R-Pi - RDK Camera - Design - M5 - 2020](#)) for how firmware upgrade works with bank switching

2. SD card should be zero filled formatted before starting the firmware upgrade procedure. DriveWipe software is used for this. Please refer the you-tube video link for the SD card full format process.

<https://youtu.be/CZhsVBEMYuk>

1.6. Limitations

RPI will support only tftp protocol . No http protocol support is provided yet.
