

scp doesn't work but SSH does

Hi,

I am trying to transfer a file from my laptop(local machine) to the Virtual Machine(Dunfell EMULATOR image runs on VM) installed on my laptop. I see the below error -

```
#scp gstaudsrvxx.c root@192.168.x.y:/home/root
Bad packet length 1950384454.
ssh_dispatch_run_fatal: Connection to 192.168.29.108 port 22: message authentication code incorrect
lost connection
```

1. IP of local machine is also in the same series -192.168.a.b. So, both are in same network.
2. ping works from local machine to VM and vice versa.
3. I am able to do SSH from local machine to VM.
4. I see the below log when I ran scp with -v option:

```
debug1: Authentication succeeded (none).
Authenticated to 192.168.29.108 ([192.168.29.108]:22).
debug1: channel 0: new [client-session]
debug1: Entering interactive session.
debug1: pledge: network
debug1: Sending environment.
debug1: Sending env LANG = en_IN
debug1: Sending command: scp -v -t /home/root
Bad packet length 1368207525.
ssh_dispatch_run_fatal: Connection to 192.168.29.108 port 22: message authentication code incorrect
```

I am unable to do a file transfer through "scp" command from local machine to VM. Can you please help me in finding what did I miss to setup?
