issue of usb-ethernet for raspberry pi 4 64bit build
With the instruction of RPI 4B Model Reference Platform with 64bit Arch, the build is successful.

But we meet two problems with:

1. Wifi is disabled after power on raspberry pi 4.

![Broken image]

Is this a known issue?

1. 2. usb-ethernet doesn't work.

There is no ethernet interface created after I connect the pc to raspberry pi 4 with usb-ethernet adapt.

Is there any issue with the usb-ethernet driver in this build?
