

[CcspTr069Pa]Is there a existed way to enable SOAP message content traced in the log file ?

Hello,

I'm investigating the connection between CcspTr069Pa between ACS Server on RPI with RDKB image. My problem is that after inform procedure successfully finished, there is no session created by CcspTr069Pa.

my code is based on the rdkb-2022q1-dunfell.

Do you know which function is for the purpose to create session after inform procedure?

Is there a existed way to enable the logs for SOAP messages between CcspTr069Pa and ACS Server? so that we can confirm what happen according to the logs.

Thank you very much!
