

Checksum mismatch! during build

Hi,

Used instructions present on URL: [RDK-B \(RaspberryPi\) Build Instructions - Morty](#) to build image for RaspberryPi. But we are getting following errors, Please recommend some solutions for the error:

ERROR: miniupnpd-1.8-20141022 do_fetch: Fetcher failure for URL: '<http://miniupnp.free.fr/files/download.php?file=miniupnpd-1.8.20141022.tar.gz>'. Checksum mismatch!

File: '/home/sandy/morty/build-raspberrypi-rdk-broadband/./downloads/download.php?file=miniupnpd-1.8.20141022.tar.gz' has md5 checksum 5920ae1240d61e85c258f8fe2062cf31 when 25d319da5aed111f498505f6a8450955 was expected

File: '/home/sandy/morty/build-raspberrypi-rdk-broadband/./downloads/download.php?file=miniupnpd-1.8.20141022.tar.gz' has sha256 checksum 92d461990376a17bde29c474fb2d3af7240c2a3f8e09a1bb91b8a8c68732c473 when e6dc0776b2af7adf815a893876617dcdbb569039844719b8d171c9209ab11ecb was expected

If this change is expected (e.g. you have upgraded to a new version without updating the checksums) then you can use these lines within the recipe:

```
SRC_URI[md5sum] = "5920ae1240d61e85c258f8fe2062cf31"
```

```
SRC_URI[sha256sum] = "92d461990376a17bde29c474fb2d3af7240c2a3f8e09a1bb91b8a8c68732c473"
```

Otherwise you should retry the download and/or check with upstream to determine if the file has become corrupted or otherwise unexpectedly modified.

ERROR: miniupnpd-1.8-20141022 do_fetch: Fetcher failure for URL: '<http://miniupnp.free.fr/files/download.php?file=miniupnpd-1.8.20141022.tar.gz>'. Unable to fetch URL from any source.

ERROR: miniupnpd-1.8-20141022 do_fetch: Function failed: base_do_fetch

ERROR: Logfile of failure stored in: /home/sandy/morty/build-raspberrypi-rdk-broadband/tmp/work/cortexa7t2hf-neon-vfpv4-rdk-linux-gnueabi/miniupnpd/1.8-20141022/temp/log.do_fetch.9710
