

ipset support for RDK-B

ipset is normally used in context of iptables.

it can help greatly in addressing domain related rules (where a single domain corresponds to many IP's) for iptables.

we currently see that, in the RDK-B emulator, ipset is not available.

is this a limitation of emulator alone? will an physical router with RDK-B stack come with ipset inbuilt?

if not, can you please describe a way to get ipset on RDK-B emulator. (kindly provide any build steps that might be required).
