

Developing Application on RDKB

we want to develop an Application on top of RDKB, which will make use of different CCSP Components to achieve its features.
To Do this:

1. Since, RDKB doesn't have a package manager such as opkg (from openwrt)
 - a. Do we have to build the application as a part of yocto ?
 - b. if so, do you have a sample for creating such application ?
 - c. we are a bit new to yocto system,
 - i. how do we create a 'recipe' to build our application?
 - ii. where would this 'recipe' sit - i mean which 'layer' ?
 - d. Any guidelines in this regard, would be appreciated.
2. How would we distribute our application ?
 - a. All our customers who will use our application, will have to build with our source?
 - b. does this also mean, we have to make our application opensource?
