

About RDK2.0 interface between mso application and Generic RDK components

Hello admin,

As far as I know, most communication between MSO Application and Generic RDK components are established through *Service Manager*(device part) & *Http*(media ctrl part) components.

I'd like to ask a question about using private method at the interface, the usage is in concordance with the RDK operation policy or not.

For instance, someone edited/added *mediastreamer* interface with using particular interface method(e.g. private RPC method) for building specific MSO Application,

in that case, the *mediastreamer* has got 1/2 methods to communicate mso application, and some 3rd-party for mso application might require the changed specification later.

I'm wondering what RDK operation policy about upper case that generic component interface changed.

Regards,

Jeong-il Choi
