

svn server ssl hand shake issue

Hi I am following the [RDK 2.0 Specification - Porting Guide - RDK Emulator](#) to setup rdk emulator/build in my ubuntu box.

How ever i am struck in step 7 (checking out the code from svn)

I am able to view/browse the svn repository from browser ,but not able to checkout the code using subversion client.

when i do svn info i get the following error

```
svn info https://svn3.teamccp.com/svn/rdk/rdk/releases/generic/components/comcast/mediaframework/trunk/  
svn: OPTIONS of 'https://svn3.teamccp.com/svn/rdk/rdk/releases/generic/components/comcast/mediaframework/trunk': SSL handshake failed:  
SSL error: The Diffie-Hellman prime sent by the server is not acceptable (not long enough). (https://svn3.teamccp.com)
```

Any idea/Suggestions?

Please note, i have configured the servers and conf files of .subversion to point to correct http_proxy server, port username and password.

also have tried enabling ssl-trust-default-ca=yes and ssl-trust-default-ca=no but none of the combination seems to work.

Any idea, what i am missing , is there any other settings changes to be made , espically related to gnuTLS libraries etc?

i am using ubuntu 12.04.03 32 bit installation.
